Configuring PHP to display errors and warnings on the webpage

By default, PHP errors are logged to a log file instead of to the screen. This is in place as a security measure, as the errors could potentially advise hackers of certain things regarding your account, including file paths. If you would prefer to have the PHP errors displayed on the screen (in addition to the log file), which would allow for easier debugging, then all you need to do is create/edit a .htaccess file. The .htaccess file is a text file that goes in your www folder. You would add the following line of text to the file:

php_flag display_errors on

If you would prefer that we do this for you, just send us an email and we'll take care of it for you. Note that this only works for PHP versions 4.4 or 5.x.
