Does LexiConn Support PHP 5? What About PHP 4?

PHP5 is the default version for all new servers and accounts. Otherwise, the version of PHP varies depending on the server your site is on. If you are on a server running PHP4 and need PHP5 for your applications, or if you have legacy applications that require PHP4 we can accomodate you, but it will require us to move your account to a server that supports the version you would like to run. You should not experience any downtime as a result of the move.

To find out what version of PHP is running on your server, create a new file on your site called 'info.php' and place the following code inside:

```
<?php phpinfo(); ?>
```

If you use SSH you can run:

```
php -v
```
