Admin Settings

The admin section for this module can be reached by going to:
http://www.your_domain.com/wishlist/admin/
Each setting in the admin section of the module is defined below:
App Document Root: This is the directory off of your main www directory where the module was installed (e.g. /wishlist).
Base Installation Directory: This is the name of the resources directory, which by default is named wresources.
Resources dir (relative to base install): This is the number of recipient lines you want to appear on the 'Email List' screen. This is the screen where list owners email their lists to friends / family.
Maximum number of recipients to send list to: This value sets the maximum number of emails your server will send for any given list in a one hour period. Once this value has been reached, the recipient field will disappear on the 'Email List' screen. It will reappear after one hour has elapsed.
Maximum number of email recipients for wishlist in 1 hour:
Fully Qualified Domain Name: This field will be set to your domain name and should not be altered.
Default setting for list email subject: This field is not currently being used to populate any email subjects.
Registration Confirmation Email From: This is the from address used when emailing list owners their registration confirmations and forgotten passwords. Be sure to use a valid email address in the event that your users reply to this address.
Require confirmation through email to open account (1=yes, 0=no): A value of '1' here would require the user to follow the instructions in the confirmation email prior to opening an account. A value of '0' here will allow users to open accounts without having to go through a confirmation process.
Registration Confirmation Email Subject: This value is the subject of the email that is sent out containing the registration confirmation instructions. This email is only sent out if a value of '1' is selected in the previous field.
Password Reminder Email Subject: This is the subject of the email sent out to wishlist owners after they submit a forgotten password request.
Number of search results per page: This value refers to the number of lists you would like displayed per page.
Require at least 1 search term to show public wishlists (1=yes, 0=no):A value of '1' here would require the user to search on any or all of the following criteria before displaying results: username, last name, city, state, or email address. A value of '0' here will display all public wishlists. The search feature will still work, but is no longer required to display public wishlists.
SMTP Host to use for outgoing mail: This field will be set to your domain name and should not be altered.
Name of this host to use when sending mail: This field will be set to your domain name and should not be altered.
SMTP Password to authenticate with when sending: This field should be left blank - no SMTP password is needed.
SMTP User to authenticate as when sending: This field should be left blank - no SMTP user is required
Shopsite item autoupdates (1 = on, 0 = off): This field should be set to '1', so that the module is synchronized with your ShopSite products database.
Shopsite product pages document root: This is your ShopSite output directory (i.e. the directory where ShopSite publishes pages to). If your output directory is your main root www folder, then this field should just have a '/' in it.
Shopsite checkout custom field name to use: This is the custom field name that has been assigned for use with this module. It is located in your ShopSite backoffice under Commerce Setup -> Order System -> Checkout: Custom fields. It is of the form fieldXX, where XX is the actual field number.
