

### **How do I Embed a Flash Video in one of My Pages?**

`$(function(){ $(".Box").css("display","none"); });` The method for embedding a Flash video file in your web page depends on which Flash format you are using. Flash video objects may be encoded in either .swf or .flv format. If you encode your video as a .flv file you will need to embed a .swf-based flash player in order to play your .flv files on the page, if you encode it as a .swf file, it can be embedded in your page directly using the following code: (replace all attribute values shown in braces with your own values)

Embed a .swf File `<embed src="[your_video_file.swf]" width="[width]" height="[height]"  
allowscriptaccess="[always|never]" wmode="[opaque|transparent|window]" allowfullscreen="[true|false]"  
flashvars="[autostart=true&...(see Flash variables)]" />`

Here is a sample with actual values:

`<embed src="myvideo.swf" width="400" height="300" allowscriptaccess="always" wmode="transparent"  
allowfullscreen="true" flashvars="autostart=true" />`

If you are encoding your Flash video in .flv format you can find a free .swf-based player (JW FLV MEDIA PLAYER) along with instructions on how to install and deploy your Flash videos here:
